1 Introduction

Winbond uClinux is an embedded Linux kernel developed based on the Linux operating system, it supports the ARM hardware platform without the MMU installed. It supports almost all of the functions of Linux operation system, including the memory management, task scheduling, interrupt handling, and almost all of system calls that Linux supported.

For the file systems, the Winbond uClinux supports the ROMFS、RAMFS、 PROC、FAT、VFAT, and it can support other file system if desired.

ROMFS is a Read-Only file system, and it is the root file system of kernel. It uses for store the utilities, device files, and user configuration files. These files need to be saved in the directory of **romdisk**, and use the **genromfs** utility to generate the ROM file system image document.

RAMFS is a RAM based read/write file system, mounted to the directory **/usr**, it uses for the storing of some temporary files, its contents will be lost after the power off.

Besides, Winbond uClinux supports the TCP/IP、PPP、UDP, … and others network protocols. It supports the multi-threads operating environment. It also supports the dynamic kernel module installation and removal (insmod, rmmod).

The Winbond uClinux implements the **execve()** function to execute the **"FLAT"** file format user applications, the **"FLAT"** file format is the only supported file format supported on the wbLinux kernel.

Winbond uCLinux software package provides the following items:

- Based on uClinux-2.4.20
- arm-elf-gcc-3.0
- Sample application execute under uCLinux environment
- arm-elf-gcc-3.3 for C++ Applications

2 Target Processor

Winbond W90P710 - ARM7TDMI based MCU.

The above information is the exclusive intellectual property of Winbond Electronics and shall not be disclosed, distributed or reproduced without permission from Winbond.

3 Supported Functions

Drivers：Ethernet MAC, four UARTs、console 、RTC, LCM, smartcard controller, PS2 keyboard, keypad, USB host controller, USB mass storage device.

File System： romfs、 ramfs、 proc、 fat、 vfat、ext2

Interrupt handler： timer、 UART 、net、 host controller

Signal manage：default signals in linux kernel (SIGCHLD,SIGKILL,SIGALRM…) 、user defined

Network Protocols：TCP, UDP, IP

4 Development Platform

Linux environement with a RedHat 6.x or higher version of Linux installed host computer with at least 800 MB free disk space.

5 Installation Procedure

Login a Linux PC.

5.1 Install the tools and development

1. Copy the **W90P710.tar.gz** to development directory, and then decompress it

```
$ tar xzvf w90P710.tar.gz
```

2. Use the root account:

```
$ su
$ Password:
# sh install.sh
```

3. Specify the absolute PATH that the SDK want to install, for example, '`/home/W90P710/`'

After decompress, the ARM GNU development tools will be installed on the `/usr/local/arm_tools`, and the uClinux-dist will be decompress the `<installed`

The above information is the exclusive intellectual property of Winbond Electronics and shall not be disclosed, distributed or reproduced without permission from Winbond.

directory>/ W90P710-uClinux directory.

4. Exit the super user mode

```
# exit
```

5. After the installation, please logout and relogin to make sure "/usr/local/arm_tools/bin" is in your path, if not, you may set the compiler path manually

"export PATH=/usr/local/arm_tools/bin:$PATH"

NOTE: The kernel configuration may not totally match with the board it came along with. Winbond provides two kernel configuration files in uClinux-dist/linux2.4.x/, .wb_ev_board for evaluation board and .wb_pos_board for POS-TAX demo board. ***It is strongly urged that users load the default setting according to the target board before first time build the kernel.*** The configuration should be loaded in kernel configuration menu, Please refer to chapter 6 for detail about the kernel configuration

5.2 Files installed

Four directories will be created under <installed directory>/ W90P710-uClinux.

Directories	Comment
uClinux-dist	W90P710 uClinux Kernel Source Code
romdisk	ROM File System Tree for W90P710 Board SYSTEM
image	Built image, **romfs.img** is the root file system image. **linux.bin** is the kernel binary execution code
TestApps	Test program on uClinux

The arm_tools.tar.gz will be installed in /usr/local/arm_tools, arm_tools_3.3.tar.gz can be installed on /usr/local/arm_tools_3.3 by manually later if support for C++ is required.

Tools installed under /usr/local/arm_tools/bin listed below:

/usr/local/arm-tools/bin	Bin Utilities include the compiler and linker etc, "install.sh" will add it to every user's PATH (/etc/Profile updated)
/usr/local/arm-tools/arm-elf/inc	Header files
/usr/local/arm-tools/arm-elf/lib	Linkable libraries(C and pthread library)

The above information is the exclusive intellectual property of Winbond Electronics and shall not be disclosed, distributed or reproduced without permission from Winbond.

5.3 Drivers and their location

```
MAC    : uClinux-dist/linux-2.4.x/drivers/net/w90p710_mac.c
UART   : uClinux-dist/linux-2.4.x/drivers/char/w90p710_uart.c
         uClinux-dist/linux-2.4.x/drivers/char/w90p710_uart_1.c
         uClinux-dist/linux-2.4.x/drivers/char/w90p710_uart_2.c
         uClinux-dist/linux-2.4.x/drivers/char/ w90p710_uart_3.c
PS2    : uClinux-dist/linux-2.4.x/drivers/char/ w90p710_ps2.c
Keypad : uClinux-dist/linux-2.4.x/drivers/char/ w90p710_keypad.c
RTC    : uClinux-dist/linux-2.4.x/drivers/char/ w90p710_rtc.c
LCM    : uClinux-dist/linux-2.4.x/drivers/media/video/ w90p710_lcd.c
VFD    : uClinux-dist/linux-2.4.x/drivers/media/video/ w90p710_vfd.c
I2C    : uClinux-dist/linux-2.4.x/drivers/char/ w90p710_i2c.c
GPIO   : uClinux-dist/linux-2.4.x/drivers/gpio/gpio_core.c
USB    : uClinux-dist/linux-2.4.x/drivers/usb/*
         uClinux-dist/linux-2.4.x/drivers/usb/wbusb/*
Flash  : uClinux-dist/linux-2.4.x/drivers/block/flash/*
MTD    : uClinux-dist/linux-2.4.x/drivers/mtd/*
Smartcard:  uClinux-dist/linux-2.4.x/drivers/char/ w90p710_sc.c
            uClinux-dist/linux-2.4.x/drivers/char/ tda8007b_sc.c
SDIO   : uClinux-dist/linux-2.4.x/drivers/scsi/ w90p710_sdio.c
Audio  : uClinux-dist/linux-2.4.x/drivers/sound/ w90p710_audio.c
            uClinux-dist/linux-2.4.x/drivers/sound/ w90p710_ac97.c
            uClinux-dist/linux-2.4.x/drivers/sound/ w90p710_i2s.c
USI    : uClinux-dist/linux-2.4.x/drivers/char/w90p710_usi.c
LCD    : uClinux-dist/linux-2.4.x/drivers/video/w90p710fb.c
            uClinux-dist/linux-2.4.x/drivers/video/w90p710_osd.c
```

The files represent each device under /dev listed in the following table:

Accessible Device Name	H/W interface	Note
/dev/ttyS0	COMA	W90P710 COM 1
/dev/ttyS1	COMB	W90P710 COM 2
/dev/ttyS2	COMC	W90P710 COM 3
/dev/ttyS3	COMD	W90P710 COM 4
/dev/rtc	RTC	Real Time Clock

The above information is the exclusive intellectual property of Winbond Electronics and shall not be disclosed, distributed or reproduced without permission from Winbond.

/dev/smartcard0	Smart Card Module	Smart Card Slot 0
/dev/smartcard1	Smart Card Module	Smart Card Slot 1
/dev/sd*	SD Card device	SDIO Module
/dev/i2c0	I2C	I2C Module
/dev/i2c1	I2C	I2C Module
/dev/keypad	Keypad	W90P710 Keypad
/dev/video0	LCM	W90P710 LCD
/dev/video2	VFD	W90P710 VFD

5.4 Build the kernel and test program

- Build kernel

```
$ cd <installed directory>/uClinux-dist/

$ make clean;make dep; make
```

The built image linux.bin will be copied to ../image

- Build W90P710 test program

Enter any folder under "TestApps", type command "make", then a new image file "romfs.img" will be found at folder "image"

Or you can use the following commands to generate a new image file:

```
$ genromfs -d romdisk -f romfs.img
```

There are 2 methods to execute the application programs. One is enter the shell command prompt after system start up, key in the application program name and execute it. Another way is to put the application program name in a file named **"init"** in the **bin** directory, the **"init"** contains all of the programs that want to be executed immediately when the system startup.

The above information is the exclusive intellectual property of Winbond Electronics and shall not be disclosed, distributed or reproduced without permission from Winbond.

6 Kernel configuration

User can type ether "make linux_menuconfig" or "make menuconfig"under uClinux-dist\, and select the option "Customize Kernel Settings", to enter the main menu of kernel configuration page. User can use arrow key to move high light item and use space key to select or un-select them.

It is strongly suggested run "make dep" after any configuration made and before build kernel.

6.1 Simplest configuration

The following items show the configuration of the most compact kernel.

```
System Type--->
        (Winbond) ARM system type
           (RAM) Kernel executes from
           (WINBOND-W90P710) Board Implementation
General setup  --->
          (ELF) Kernel core (/proc/kcore) format
Block devices  --->
           [*] ROM disk memory block device (blkmem)
           (W90P710)   FLASH type
File systems  --->
           [*] ROM file system support
Character devices  --->
          [*] Winbond W90P710 serial port support
           [*]   Support for console on Winbond W90P710 serial port
```

This configuration support the ramfs and romfs two basic file system, and only the ELF-flat format binary file can be executed.(no compressed flat format supported)

6.2 Detailed configuration

If more functions need to be supported on kernel, then before the kernel rebuild, it needs to do the selected kernel configuration, the following sessions describe the procedures to do configurations. These configurations are verified on the system. However, some of configurations of the network drivers, file systems, and network protocols are still on the alpha-test stage (such as, PPPoE), it needs to turn on the configuration of "**Code maturity level options ---> Prompt for development and/or incomplete code/drivers"**.

The above information is the exclusive intellectual property of Winbond Electronics and shall not be disclosed, distributed or reproduced without permission from Winbond.

6.2.1 Enable the code maturity selection

```
Code maturity level options  --->
       [*] Prompt for development and/or incomplete code/drivers
```

6.2.2 Loadable module support

```
Loadable module support  --->
                  [*] Enable loadable module support
```

6.2.3 Compressed FLAT file format support (ZFLAT)

```
General setup  --->
              [*]     Enable ZFLAT support
```

6.2.4 Network protocols and devices support

Select the "Networking support" in "General setup", then the menus of the "Networking options" and "Network drvice support" of main menu on the linux kernel will appear.

```
General setup  --->
               [*] Networking support
```

6.2.4.1 TCP/IP protocol support

```
Networking options  --->
                   [*] TCP/IP networking
```

6.2.4.2 PPP support (point-to-point protocol)

```
Network device support  --->
                  [*] Network device support?
                  <*> PPP (point-to-point protocol) support
                  [*]   PPP Deflate compression
                  [*]   PPP over Ethernet (EXPERIMENTAL)
```

6.2.4.3 W90P710 Ethernet Controller device driver support

```
Network device support  --->
       Ethernet (10 or 100Mbit)  --->
                  [*] Ethernet (10 or 100Mbit)
                  [*]   Winbond W90P710 Embedded Ethernet support
```

The above information is the exclusive intellectual property of Winbond Electronics and shall not be disclosed, distributed or reproduced without permission from Winbond.

6.2.4.4 File systems support

6.2.4.4.1 ext3 support

```
File systems  --->
            [*] Ext3 journalling file system support
          Partition Types  --->
            [*] Advanced partition selection
            [*]   PC BIOS (MSDOS partition tables) support
```

6.2.4.4.2 FAT-based file systems(MS-DOS, VFAT) support

```
File systems  --->
 [*] DOS FAT fs support
 [*]   MSDOS fs support
 [*]   VFAT (Windows-95) fs support
 Partition Types  --->
      [*] Advanced partition selection
      [*]   PC BIOS (MSDOS partition tables) support
      Native Language Support  --->
      [*] Codepage 437 (United States, Canada) (NEW)
      [*] NLS ISO 8859-1 (Latin 1; Western European Languages) (NEW)
```

6.2.4.4.3 ext2 support

```
File systems  --->
        [*] Second extended fs support
         Partition Types  --->
           [*] Advanced partition selection
           [*]   PC BIOS (MSDOS partition tables) support
```

6.2.4.4.4 /proc file system support

```
File systems  --->
            [*] /proc file system support
```

6.2.4.4.5 nfs support

```
File systems  --->
      Network File Systems  --->
           [*] NFS file system support
           [*]   Provide NFSv3 client suppor
```

6.2.4.4.6 devfs support

```
File systems  --->
            [*] /dev file system support (EXPERIMENTAL)
            [*]   Automatically mount at boot
```

The above information is the exclusive intellectual property of Winbond Electronics and shall not be disclosed, distributed or reproduced without permission from Winbond.

6.2.4.4.7 USB device support

First, configure the the support of USB host controller - OHCI host interface.

```
USB support  --->
                [*] Support for USB
                [*]  OHCI (Compaq, iMacs, OPTi, SiS, ALi, ...) support
```

USB Mass Storage device support

```
SCSI support  --->
                 [*] SCSI support
                 [*]   SCSI disk support
USB support  --->
                [*]   USB Mass Storage support
```

7 Kernel module programming

If the developer wants to the do the programming of kernel module (such as, device drivers), the kernel module can only calls the kernel functions, and its associated header files. Use the gcc to compile to .o object files. There are 2 ways to install the .o object files into the kernel.

Method 1:

Modify the makefile for the kernel, add the .o object file name into the link section, rebuild the kernel to get a updated kernel, tftp the Linux binary code to development boards.

Method 2:

Put the **.o** file to the **romdisk**, build the **romfs.img**. Download it to the development board, run it. On the shell command prompt, key in **insmod XXX.o**, the **insmod** will install the module into the kernel, and it use the **rmmod XXX** to remove the module from kernel. User can use **lsmod** to display all of the installed modules.

8 Virtual debug device usage

If the default console device (dev/console) or the serial port wants to be used as other purpose (such as modem), this platform provides another "Virtual debug device" - /dev/vdd0 as the console device to save the message print to *stdout* and *strerr*. To enable this device, it needs to configur it into the kernel.

```
Character devices  --->

                  [*] Virtual debug device support
```

If this configuration is selected, then the CONFIG_VDD was defined on the include/linux/autoconf.h,

The above information is the exclusive intellectual property of Winbond Electronics and shall not be disclosed, distributed or reproduced without permission from Winbond.

then the init functions in init/main.c will be compiled to use the /dev/vdd0 as the default console.

```
#ifndef CONFIG_VDD
     if (open("/dev/console", O_RDWR, 0) < 0)
          printk("Warning: unable to open an initial console.\n");
#else
     if (open("/dev/vdd0", O_RDWR, 0) < 0)
          printk("Warning: unable to open an initial console.\n");
#endif
dup(0);
dup(0);
……
execve("/bin/sh",argv_sh,envp_init);
```

Open the /dev/vdd0 as the fd 0, the call the dup(0) twice to get the fd 1(stdout), and 2(stderr), then call execve() to execute the user program. All of the printed message will be redirected to /dev/vdd0.

Following example illustrate how to check the message recorded on `/dev/vdd0`

The user program test.c:

```
#include <stdio.h>

int main(void)
{
     int i=0;
     while(1)
     {
          printf("hello ");
          fflush(stdout);
          fprintf(stderr,"world %d\n",i++);
          if(i == 1000)
          i=0;
     }
     return 0;
}
```

Copy the compiled and executable program test to romdisk/bin/, change it to executable permission, and make a device file vdd0. The /dev/vdd0 use major device number 99, minor device number 0.

```
$ mknod vdd0 c 99 0
```

The above information is the exclusive intellectual property of Winbond Electronics and shall not be disclosed, distributed or reproduced without permission from Winbond.

Modify the `romdisk/bin/init` as followed,

```
mount -t proc none /proc
mount -t ramfs none /usr
mount -t ramfs none /swap
ifconfig eth1 10.130.2.103 netmask 255.255.0.0
inetd&
test
```

Use the genromfs to generate the romfs.img, and the updated linux.bin with /dev/vdd0 supported. When system startup, telnet to the target system, then 'cat /dev/vdd0' to get the message printed by test.

Currently, the buffer size provides by the /dev/vdd0 is 2KB, if the buffer size needs to be increase, the Line 27 in uClinux-dist/linux-2.4.x/drivers/char/vdd.c can be changed to set the desired buffer size, then rebuild the kernel.

```
#define DEBUGBUF_SIZE   (1024 * 2)
```

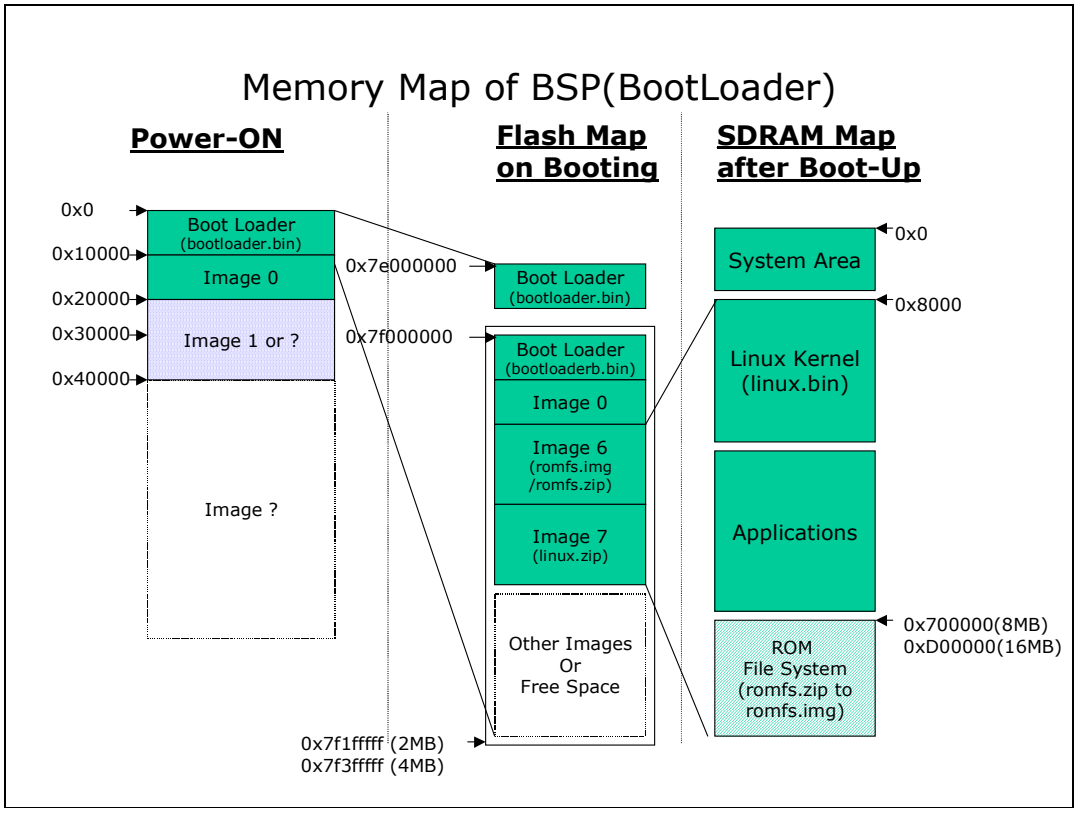
9 Update Kernel and ROM File System

This chapter describes how to update kernel and ROM file system onto FLASH, as well as some kernel configuration regarding the ROM file system location. Users could also refer to "**W90P710 Bootloader users manual.pdf**" for more detail of bootloader operation

The bootloader will scan the image sequentially, and process the active images according to their attribute. So you need to configure ROM file system image as the image 6(or other number smaller than 7), and Linux kernel as image 7(or other unused ID number grater than ROM file system's image ID). The address of the images in FLASH is not relevant as long as they are not overlapped. The following table lists the basic flash map of uClinux system and the bootloader.

We suggest user compress the Linux kernel image to save flash space. And the ROM file system image could also be a compressed if you want to copy it to SDRAM during run time. Figure below shows the Memory Map of the BootLoader after loads uCLinux kernel and Romfs to SDRAM.

The above information is the exclusive intellectual property of Winbond Electronics and shall not be disclosed, distributed or reproduced without permission from Winbond.



9.1 Flash Configurations

The Linux kernel image should always be compressed to save FLASH space, and uncompress to SDRAM address 0x8000 for executing. The command for updating kernel listed below:

```
bootloader> ft 7 linux.zip 0x7f020000 0x8000 –acxz
or
bootloader> fx 7 linux.zip 0x7f020000 0x8000 –acxz
```

Three types of ROM file system configuration are supported. it can either be compressed or not. If ROM file system is not compressed, it could reside in ether SDRAM or FLASH during run time.

9.2 Configuration method 1

ROM file system image (romfs.img) located at 0x7F0C0000 as image 6, runtime address 0x7F0C0000. Command for updating ROM file system listed below:

```
bootloader> ft 6 romfs.img 0x7F0C0000 0x7F0C0000 –a
or
```

The above information is the exclusive intellectual property of Winbond Electronics and shall not be disclosed, distributed or reproduced without permission from Winbond.

bootloader> fx 6 romfs.img 0x7F0C0000 0x7F0C0000 –a

9.3 Configuration method 2

Compressed ROM file system image (`romfs.zip`) located at 0x7F0C0000 as image 6, runtime address 0xD00000. Command for updating ROM file system listed below:

bootloader> ft 6 romfs.zip 0x7F0C0000 0xD00000 –acz
or
bootloader> fx 6 romfs.zip 0x7F0C0000 0xD00000 –acz

9.4 Configuration method 3

ROM file system image (`romfs.img`) located at 0x7F0C0000 as image 6, runtime address 0xD00000. Command for updating ROM file system listed below:

```
bootloader> ft 7 romfs.img 0x7F0C0000 0xD00000 –ac
or
bootloader> fx 7 romfs.img 0x7F0C0000 0xD00000 –ac
```

9.5 Adjust ROMFS starting address

The default ROMFS memory location is 0xD00000 in SDRAM. Here use the chang of ROMFS location to 0xC0000 as an example to point out the modification needs to be take:

```
linux-2.4.x\drivers\block\blkmem.c in blkmem_init()
    arena[i].address=0xC00000;
linux-2.4.x/arch/armnommu/kernel/setup.c
    #define MEM_SIZE (12*1024*1024)
make menuconfig
```

Change the DRAM Size from `0xD00000` to ***0xC00000***

9.6 Load the images to SDRAM

During the development stage, user may choose to load images to SDRAM instead writing them to FLASH, below listed the steps to do so:

Load ROMFS to SDRAM:
`mt 0xd00000 or mx 0xd00000`

The above information is the exclusive intellectual property of Winbond Electronics and shall not be disclosed, distributed or reproduced without permission from Winbond.

Load kernel to SDRAM:
```
mt 0x8000 or mx 0x80000
```

Execute image:
```
g 0x8000
```

9.7 Build the production F/W image of flash

The final flash image on production can be built by the mkrom tool, the mkrom tool will combine the bootloader image (bootloader.bin), image 0 for system configuration information, image 6 ROM file system image (romfs.img), and image 7 compressed linux kernel (linux.zip) to a final image of flash.

User can consult "Make a Production ROM" for the usage to mkrom tool.

10 Shell and other applications

Shell is the basic application on the Linux system, default shell provided in BSP is "sh". "sh" uses the current directory as the prompting string. Commands can be executed under shell. (It works the same way as PC Linux). Key in help under shell will display the internal commands provided by shell.

command	**description**	**usage**
cat	Show file on screen	Cat filename
cd	change current directory	cd [directory]
chgrp	change the group membership of each FILE to GROUP	chgrp GROUP FILE...
chmod	change file/directory mode	chmod mode file/dir
chown	change file/directory own	chown group:user file/dir
cmp	cmpare two files	cmp file1 file2

The above information is the exclusive intellectual property of Winbond Electronics and shall not be disclosed, distributed or reproduced without permission from Winbond.

date	Get/set date	date [MMDDhhmm[YYYY]]
cp	copy source to destination	cp file1 file2
df	Show information about the filesystem on which each FILE resides, or all filesystems by default.	df [device]
echo	Output the ARGs or redirectory to file	echo arguments [> filename]
exec	Exec FILE, replacing this shell with the specified program	exec file
exit	Exit the shell with a status of N. If N is omitted, the exit status is that of the last command executed	exit [N]
free	show memory status	free
help	show help message	help
hexdump	hex dump file	hexdump file
hostname	show host name	hostname
kill	send signal to process	kill [-s sigspec | -n signum | -sigspec] [pid | job]...\n or kill -l [sigspec]
ln	Create a link to the specified TARGET	ln –s file1 file2

The above information is the exclusive intellectual property of Winbond Electronics and shall not be disclosed, distributed or reproduced without permission from Winbond.

ls	List information about the FILEs	ls [options]
mkdir	Create the DIRECTORY	mkdir dirname
mknod	Create device file	mknod type major minor
more	File perusal filter	more filename
mount	Mount file system	mount –t type device dir
mv	Rename SOURCE to DEST, or move SOURCE(s) to DIRECTORY	mv source dest
printenv	Print environment varables	printenv
pid	Show current process	pid
ps	Show process information	ps
pwd	Show current dirctory	pwd
quit	Quit current process	quit
rm	Remove file	rm file
rmdir	Remove dir	rmdir dir
sleep	sleep several seconds	sleep number
setenv	Set environment varable	setenv var value
source	Run command in file	source file
sync	System sync	sync
touch	Update the access and	touch [option] file

The above information is the exclusive intellectual property of Winbond Electronics and shall not be disclosed, distributed or reproduced without permission from Winbond.

	modification times of each FILE to the current time	
umask	The user file-creation mask is set to MODE	umask octal number
umount	Umount file system	umount dir

a. ifconfig

It used to configure the network interfaces, such as,

```
# ifconfig eth0 192.168.0.10 netmask 255.255.255.0
```

b. route

It used to manipulates the IP routing tables

```
# route add default netmask 255.255.255.0 gw 192.168.0.1 eth0
```

c. dhcpc

dhcp client application

```
# dhcpc eth0
```

d. init

Script "init", which located under "romdisk\bin" directory, contains all the applications want to be executed while starting up. There are some commands in "init" which have been marked. They are examples of using "ifconfig", mount command etc. You may un-comment and modify them to fit your need.

Please note, the last user program in init should be an endless loop program, such as "sh", or it will generate the Kernel panic.

The above information is the exclusive intellectual property of Winbond Electronics and shall not be disclosed, distributed or reproduced without permission from Winbond.

11 System call and library

Almost all of the functions are compatible with the POSIX defined functions, a little part of them were designed for the convenience of program developing. The verification programs are included on the SDK. Note that the functions end with _**r** have the same functionality as no _**r** appended, but functions end with _**r** indicate that these functions are reentrant, it indicates that they can be used on the multi-thread operation environment without the risk of inconsistence.

The above information is the exclusive intellectual property of Winbond Electronics and shall not be disclosed, distributed or reproduced without permission from Winbond.

11.1.1 time/

11.1.1.1 char *asctime(const struct tm * timeptr);
11.1.1.2 char *asctime_r(const struct tm * timeptr, char * buf);
